Regular Expressions and Regular Languages

Why do they have such similar names?

Theorem

L is a regular language if and only if there is a regular expression R such that $L(R) = L$

i.e., Regular expressions have the same “expressive power” as finite automata.

Proof.

- Given regular expression R , can construct NFA N such that $L(N) = L(R)$
- Given DFA M , will construct regular expression R such that $L(M) = L(R)$

DFA to Regular Expression

- Given DFA M , will construct regular expression R such that $L(M) = L(R)$. **In two steps:**
 - Construct a “Generalized NFA” (GNFA) G from the DFA M
 - And then convert G to a regex R

Generalized NFA

- A GNFA is similar to an NFA, but:
 - There is a single accept state.
 - The start state has no incoming transitions, and the accept state has no outgoing transitions.
 - These are “cosmetic changes”: Any NFA can be converted to an equivalent NFA of this kind.
 - The transitions are labeled not by characters in the alphabet, but by **regular expressions**.
 - For **every** pair of states (q_1, q_2) , the transition from q_1 to q_2 is labeled by a regular expression $\rho(q_1, q_2)$.
 - “Generalized NFA” because a normal NFA has transitions labeled by ϵ , elements in Σ (a union of elements, if multiple edges between a pair of states) and \emptyset (missing edges).

Generalized NFA

- Transition: GNFA **non-deterministically** reads a block of characters from the input, chooses an edge from the current state q_1 to another state q_2 , and if the block of symbols matches the regex $\rho(q_1, q_2)$, then moves to q_2 .
- Acceptance: G accepts w if there exists some sequence of valid transitions such that on starting from the start state, and after finishing the entire input, G is in the accept state.

Generalized NFA: Example

Example GNFA G

Accepting run of G on 11110100 is

Generalized NFA: Example

Example GNFA G

Accepting run of G on 11110100 is

$$q_0 \xrightarrow{1} q_1$$

Generalized NFA: Example

Example GNFA G

Accepting run of G on 11110100 is

$$q_0 \xrightarrow{1}_G q_1 \xrightarrow{11}_G q_1$$

Generalized NFA: Example

Example GNFA G

Accepting run of G on 11110100 is

$$q_0 \xrightarrow{1} q_1 \xrightarrow{11} q_1 \xrightarrow{101} q_1$$

Generalized NFA: Example

Example GNFA G

Accepting run of G on 11110100 is

$q_0 \xrightarrow{1}_G q_1 \xrightarrow{11}_G q_1 \xrightarrow{101}_G q_1 \xrightarrow{00}_G q_2$

Generalized NFA: Definition

Definition

A generalized nondeterministic finite automaton (GNFA) is

$G = (Q, \Sigma, q_0, q_F, \rho)$, where

- Q is the finite set of states
- Σ is the finite alphabet
- $q_0 \in Q$ initial state

Generalized NFA: Definition

Definition

A generalized nondeterministic finite automaton (GNFA) is

$G = (Q, \Sigma, q_0, q_F, \rho)$, where

- Q is the finite set of states
- Σ is the finite alphabet
- $q_0 \in Q$ initial state
- $q_F \in Q$, a single accepting state

Generalized NFA: Definition

Definition

A generalized nondeterministic finite automaton (GNFA) is

$G = (Q, \Sigma, q_0, q_F, \rho)$, where

- Q is the finite set of states
- Σ is the finite alphabet
- $q_0 \in Q$ initial state
- $q_F \in Q$, a single accepting state
- $\rho : (Q \setminus \{q_F\}) \times (Q \setminus \{q_0\}) \rightarrow \mathcal{R}_\Sigma$, where \mathcal{R}_Σ is the set of all regular expressions over the alphabet Σ

Generalized NFA: Definition

Definition

For a GNFA $M = (Q, \Sigma, q_0, q_F, \rho)$ and string $w \in \Sigma^*$, we say M **accepts** w iff there exist $x_1, \dots, x_t \in \Sigma^*$ and states r_0, \dots, r_t such that

- $w = x_1 x_2 x_3 \cdots x_t$
- $r_0 = q_0$ and $r_t = q_F$
- for each $i \in [1, t]$, $x_i \in L(\rho(r_{i-1}, r_i))$,

Converting DFA to GNFA

A DFA $M = (Q, \Sigma, \delta, q_0, F)$ can be easily converted to an equivalent GNFA $G = (Q', \Sigma, q'_0, q'_F, \rho)$:

- $Q' = Q \cup \{q'_0, q'_F\}$ where $Q \cap \{q'_0, q'_F\} = \emptyset$
- $\rho(q_1, q_2) = \begin{cases} \epsilon, & \text{if } q_1 = q'_0 \text{ and } q_2 = q_0 \\ \epsilon, & \text{if } q_1 \in F \text{ and } q_2 = q'_F \\ \bigcup_{\{a \mid \delta(q_1, a) = q_2\}} a & \text{otherwise} \end{cases}$

Prove: $L(G) = L(M)$.

GNFA to Regex

- Suppose G is a GNFA with only two states, q_0 and q_F .
- Then $L(R) = L(G)$ where $R = \rho(q_0, q_F)$.
- How about G with three states?

- Plan: Reduce any GNFA G with $k > 2$ states to an equivalent GFA with $k - 1$ states.

GNFA to Regex: From k states to $k - 1$ states

Definition (Deleting a GNFA State)

Given GNFA $G = (Q, \Sigma, q_0, q_F, \rho)$ with $|Q| > 2$, and any state $q^* \in Q \setminus \{q_0, q_F\}$, define GNFA $\text{rip}(G, q^*) = (Q', \Sigma, q_0, q_F, \rho')$ as follows:

- $Q' = Q \setminus \{q^*\}.$

GNFA to Regex: From k states to $k - 1$ states

Definition (Deleting a GNFA State)

Given GNFA $G = (Q, \Sigma, q_0, q_F, \rho)$ with $|Q| > 2$, and any state $q^* \in Q \setminus \{q_0, q_F\}$, define GNFA $\text{rip}(G, q^*) = (Q', \Sigma, q_0, q_F, \rho')$ as follows:

- $Q' = Q \setminus \{q^*\}$.
- For any $(q_1, q_2) \in Q' \setminus \{q_F\} \times Q' \setminus \{q_0\}$ (possibly $q_1 = q_2$), let

$$\rho'(q_1, q_2) = (R_1 R_2^* R_3) \cup R_4,$$

where $R_1 = \rho(q_1, q^*)$, $R_2 = \rho(q^*, q^*)$, $R_3 = \rho(q^*, q_2)$ and $R_4 = \rho(q_1, q_2)$.

Claim. For any $q^* \in Q \setminus \{q_0, q_F\}$, G and $\text{rip}(G, q^*)$ are equivalent.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.
- If $s_{j-1} = r_{a-1}$ and $s_j = r_b$, then $x_{[a,b]} \in L(\rho'(s_{j-1}, s_j))$

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.
- If $s_{j-1} = r_{a-1}$ and $s_j = r_b$, then $x_{[a,b]} \in L(\rho'(s_{j-1}, s_j))$
 - Let $R_1 = \rho(s_{j-1}, q^*)$, $R_2 = \rho(q^*, q^*)$, $R_3 = \rho(q^*, s_j)$ and $R_4 = \rho(s_{j-1}, s_j)$. Then $\rho'(s_{j-1}, s_j) = R_4 \cup (R_1 R_2^* R_3)$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.
- If $s_{j-1} = r_{a-1}$ and $s_j = r_b$, then $x_{[a,b]} \in L(\rho'(s_{j-1}, s_j))$
 - Let $R_1 = \rho(s_{j-1}, q^*)$, $R_2 = \rho(q^*, q^*)$, $R_3 = \rho(q^*, s_j)$ and $R_4 = \rho(s_{j-1}, s_j)$. Then $\rho'(s_{j-1}, s_j) = R_4 \cup (R_1 R_2^* R_3)$.
 - **Case $a = b$.** $(s_{j-1}, s_j) = (r_{b-1}, r_b)$ and $x_{[a,b]} = x_b \in L(R_4)$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.
- If $s_{j-1} = r_{a-1}$ and $s_j = r_b$, then $x_{[a,b]} \in L(\rho'(s_{j-1}, s_j))$
 - Let $R_1 = \rho(s_{j-1}, q^*)$, $R_2 = \rho(q^*, q^*)$, $R_3 = \rho(q^*, s_j)$ and $R_4 = \rho(s_{j-1}, s_j)$. Then $\rho'(s_{j-1}, s_j) = R_4 \cup (R_1 R_2^* R_3)$.
 - **Case $a = b$.** $(s_{j-1}, s_j) = (r_{b-1}, r_b)$ and $x_{[a,b]} = x_b \in L(R_4)$.
 - **Case $a = b + 1 + u$.** $x_a \in L(R_1)$, $x_{a+1}, \dots, x_{b-1} \in L(R_2)$ and $x_b \in L(R_3)$. So $x_{[a,b]} \in L(R_1 R_2^u R_3)$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.
- If $s_{j-1} = r_{a-1}$ and $s_j = r_b$, then $x_{[a,b]} \in L(\rho'(s_{j-1}, s_j))$
- Let y_1, \dots, y_d be the sequence of blocks of the form $x_{[a,b]}$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .
- For any *run* of q^* — i.e., an interval $[a, b]$ s.t. $r_{a-1} \neq q^* = r_a = \dots = r_{b-1} \neq r_b$ — let $x_{[a,b]} = x_a \cdots x_b$.
- If $s_{j-1} = r_{a-1}$ and $s_j = r_b$, then $x_{[a,b]} \in L(\rho'(s_{j-1}, s_j))$
- Let y_1, \dots, y_d be the sequence of blocks of the form $x_{[a,b]}$.
- Then $w = y_1 \cdots y_d$ and $y_j \in L(\rho'(s_{j-1}, s_j))$.

GNFA to Regex: From k states to $k - 1$ states

$$w \in L(G) \implies w \in L(G')$$

Proof.

- $w \in L(G) \implies w = x_1 x_2 x_3 \cdots x_t$, and a sequence of states $q_0 = r_0, r_1, \dots, r_t = q_F$ s.t. $x_i \in L(\rho(r_{i-1}, r_i))$.
- Let $(q_0 = s_0, \dots, s_d = q_F)$ be the subsequence of states obtained by deleting all occurrences of q^* .

- To build a sequence of blocks x_1, \dots, x_t and a sequence of states $q_0 = r_0, \dots, r_t = q_F$ to show $w \in L(G)$:
 - Case $y_j \in L(R_4)$.** Retain the block y_j and retain s_{j-1} and s_j as adjacent states.
 - Case $y_j \in L(R_1 R_2^* R_3)$.** $y_j = z_0 \cdots z_{u+1}$ where $z_0 \in L(R_1)$, $z_1, \dots, z_u \in L(R_2)$ and $z_{u+1} \in L(R_3)$ (for some finite u). Insert $u + 1$ copies of q^* between s_{j-1} and s_j . Divide y_j into $u + 2$ blocks (z_0, \dots, z_{u+1}) .

DFA to Regex: Summary

Lemma

For every DFA M , there is a regular expression R such that $L(M) = L(R)$.

DFA to Regex: Summary

Lemma

For every DFA M , there is a regular expression R such that $L(M) = L(R)$.

- Any DFA can be converted into an equivalent GNFA. So let G be a GNFA s.t. $L(M) = L(G)$.
- For any GNFA $G = (Q, \Sigma, q_0, q_F, \rho)$ with $|Q| > 2$, for any $q^* \in Q \setminus \{q_0, q_F\}$, G and $\text{rip}(G, q^*)$ are equivalent.

DFA to Regex: Summary

Lemma

For every DFA M , there is a regular expression R such that $L(M) = L(R)$.

- Any DFA can be converted into an equivalent GNFA. So let G be a GNFA s.t. $L(M) = L(G)$.
- For any GNFA $G = (Q, \Sigma, q_0, q_F, \rho)$ with $|Q| > 2$, for any $q^* \in Q \setminus \{q_0, q_F\}$, G and $\text{rip}(G, q^*)$ are equivalent. $\text{rip}(G, q^*)$ has one fewer state than G .
- So given G , by applying rip repeatedly (choosing q^* arbitrarily each time), we can get a GNFA G' with two states s.t. $L(G) = L(G')$. Formally, by induction on the number of states in G .
- For a 2-state GNFA G' , $L(G') = L(R)$, where $R = \rho(q_0, q_F)$.
